Identity Protection | Users at risk detected alerts

Download

Users in the Global Administrator, Security Administrator, or Security Reader roles are automatically added to this list if that user has a valid "Email" or "Alternate email" configured. We attempt to send emails to the first 20 members of each role. If a user is enrolled in PIM to elevate to one of these roles on demand then they will only receive emails if they are elevated at the time the email is sent. The Admin's configured email must be able to pass the validation checks for custom emails on the "Users at risk detected alerts" page. Learn more

Audit and configuration operations inside virtual machines.

Azure Automation Linux Hybrid Worker

Azure Pipelines Agent For Linux

Azure AD based SSH Login

Publisher: Microsoft Corp.

Overview

There are many security benefits of using Azure AD with SSH log in to Linux VMs in Azure, including:

- Use your Azure AD credentials to log in to Azure Linux VMs.
- Get SSH certificate-based authentication without needing to distribute SSH keys to users or provision SSH public keys on any Azure Linux VMs you deploy. This experience is much simpler than having to worry about sprawl of stale SSH public keys that could cause unauthorized access.
- Reduce reliance on local administrator accounts, credential theft, and weak credentials.
- Password complexity and password lifetime policies configured for Azure AD help secure Linux VMs as well.
- With Azure role-based access control, specify who can login to a VM as a regular user or with administrator privileges. When users join or leave your team, you can update the Azure RBAC policy for the VM to grant access as appropriate. When employees leave your organization and their user account is disabled or removed from Azure AD, they no longer have access to your resources.
- With Conditional Access, configure policies to require multi-factor authentication and/or require client device you are using to SSH be a managed device (for example: compliant device or hybrid Azure AD joined) before you can SSH to Linux VMs.
- Use Azure deploy and audit policies to require Azure AD login for Linux VMs and to flag use of non-approved local accounts on the VMs.

*** Tenant onboarding is currently in progress. This may take a few minutes to complete. Activating Global Secure Access in your tenant [Learn more](#)

Activate the Global Secure Access, which includes Microsoft Entra Internet Access and Microsoft Entra Private Access. [Learn more](#)

1. Global Secure Access prerequisites

- You have the required administrator role to activate the Global Secure Access.
- You have the required license to start using Global Secure Access

A Global Secure Access Administrator, Security Administrator, or Global Administrator must be assigned to activate and manage Global Secure Access features [Learn more](#)

2. Activate Global Secure Access in your tenant

Tenant onboarding is currently in progress and may take several minutes to complete. During this time, you may not have access to the product.

To activate Global Secure Access, click the activate button below. Note activation will not impact any workload in your tenant until preview features are enabled.

3. Get started with Global Secure Access

Learn about Global Secure Access and the next steps for getting started.

Private Network Connector Download

Microsoft Entra ID

Download and install the Private Network connector to enable a secure connection between applications inside your network and the Private Network connector. Only one installation is necessary to service all your published applications; a second connector can be installed for high availability purposes.

System Requirements

- Operating Systems
 - Windows Server 2012 R2 or later
- Make sure the network is configured correctly for the connector.
[Learn more](#)
- The connector must have access to all on premises applications that you intend to publish.

Installation Instructions

To install the Private Network connector, download the connector installation package and install it on a local, designated machine. For more information on the Private Network connector, see [our online content](#).

By downloading the connector, you accept our [Terms of Service](#).

Permission classifications

Control when end users and group owners are allowed to grant consent to applications, and when they will be required to request administrator review and approval. Allowing users to grant apps access to data helps them acquire useful applications and be productive, but can represent a risk in some situations if it's not monitored and controlled carefully.

User consent for applications

Configure whether users are allowed to consent for applications to access your organization's data. [Learn more](#)

☐ Do not allow user consent

An administrator will be required for all apps.

☐ Allow user consent for apps from verified publishers, for selected permissions (Recommended)

All users can consent for permissions classified as "low impact", for apps from verified publishers or apps registered in this organization.

☒ Allow user consent for apps

All users can consent for any app to access the organization's data.

With your current user settings, all users can allow applications to access your organization's data on their behalf. [Learn more about the risks](#)

Microsoft recommends allowing user consent only for verified app publishers or apps from your organization, for permissions you classify as "low impact". [Learn more](#)

Group owner consent settings have been removed and replaced with Team owner consent settings. [Learn more](#)

Redirect URIs

The URIs we will accept as destinations when returning authentication responses (tokens) after successfully authenticating or signing out users. The redirect URI you send in the request to the login server should match one listed here. Also referred to as reply URLs. [Learn more about Redirect URIs and their restrictions](#)

App roles

App roles are custom roles to assign permissions to users or apps. The application defines and publishes the app roles and interprets them as permissions during authorization.
